Technical Skills

- Languages: TypeScript, JavaScript, Go, Java, Python, SQL, Dart
- Frontend and Mobile: Next.js, React, Flutter, Tailwind CSS, Progressive Web Apps (PWA)
- Backend: Fiber, Express.js, Spring Boot, Reactor Netty, FastAPI, Node.js, REST APIs
- Data: PostgreSQL, Redis, Supabase
- DevOps: Docker, GitHub Actions, Git, GCP

Summary

Hello 👋, I'm Dayat! An Informatics graduate from Universitas Syiah Kuala with 1.5+ years of experience in Full Stack Development, building end-to-end applications from frontend and business logic to backend systems and databases. I've worked on projects across healthcare, education, government, and more. This portfolio showcases what I've built and learned throughout my 1.5+ years of grinding. Btw, nice to meet u!

Education & Training

- Bachelor of Informatics (Computer Science)
  Universitas Syiah Kuala, Banda Aceh
  Aug 2022 – Jun 2026 | GPA: 3.51/4.00
- Coding Camp powered by DBS Foundation
  Front-End & Back-End Development Program
  Feb 2025 – Jul 2025 | Remote

Experience

- Full Stack Developer - Universitas Syiah Kuala, Research Project (Jul 2026 – Dec 2026)
- Full Stack Developer - Universitas Syiah Kuala, Community Service Project (Aug 2025 - Dec 2025)
- AI Engineer Intern - Diskominsa Aceh (Aug 2025 – Sep 2025)
- Teaching Assistant — Software Architecture, DevOps & Software Quality (Sep 2025 – Jun 2026)

Organizations

- Head of Student Welfare Management Department - HMIF (Feb 2025 - Mar 2026)
- Staff of Student Welfare Management Department - HMIF (Feb 2024 - Feb 2025)

Achievements

- 2nd Place — INFINITERA 1.0 National Web Programming Competition (2025)
- 4th Place — INFEST XI National Hackathon (2025)
- Top 20 Finalist — LIDM ITDP National Competition (2025)
- Top 20 Capstone Team, DBS Foundation Coding Camp (2025)

Certifications

- Participant of Hackathon 8.0: "Hack the Horizon: Redefining Boundaries with Code" — Bina Nusantara Computer Club (BNCC)
- Coding Camp 2025 – Front-End and Back-End Developer Path — Dicoding Indonesia
- Coding Camp 2025 – Capstone Project (Top 20 Team) — Dicoding Indonesia
- English for Business Communication — TBI (The British Institute)
- Belajar Back-End Pemula dengan JavaScript — Dicoding Indonesia
- Belajar Pengembangan Web Intermediate — Dicoding Indonesia
- Financial Literacy 101 — Dicoding Indonesia
- Belajar Fundamental Front-End Web Development — Dicoding Indonesia
- Belajar Membuat Front-End Web untuk Pemula — Dicoding Indonesia
- Belajar Dasar Pemrograman JavaScript — Dicoding Indonesia
- Belajar Dasar Pemrograman Web — Dicoding Indonesia
- Belajar Dasar Git dengan GitHub — Dicoding Indonesia
- Pengenalan ke Logika Pemrograman (Programming Logic 101) — Dicoding Indonesia
- Memulai Dasar Pemrograman untuk Menjadi Pengembang Software — Dicoding Indonesia
- Belajar Dasar AI — Dicoding Indonesia
- Belajar Dasar Pemrograman Web — Dicoding Indonesia
- React Dasar (Gold) — Skilvul

"A digital health platform designed to support diabetes self-management and connect patients with healthcare providers through an integrated mobile and web system."

Project Type

Research Project

Timeline

Jul 2026 - Dec 2026

Organization

Universitas Syiah Kuala

Publication Link

github.com/Hidayattt24/dsmes-web
github.com/Hidayattt24/dsmes-backend
github.com/Hidayattt24/dsmes-mobile

01. How It All Started

Initiated by Ns. Farah Diba, MScPH, as part of her academic research, DIBA began with a concern over the challenges of managing type 2 diabetes in Banda Aceh, particularly limited access to continuous education, treatment adherence, and patient self-management. This inspired the development of a digital platform connecting everyday patient care with healthcare monitoring.

02. Our Approach

To address these challenges, we developed DIBA as an integrated digital health platform connecting patients and healthcare providers. We translated research requirements into system workflows and selected a technology stack tailored to each platform's needs, using Flutter for mobile, Next.js for web, and Go/Fiber with PostgreSQL for the backend. Through this approach, we aim to make diabetes self-management more accessible, structured, and continuous.

github.com/Hidayattt24

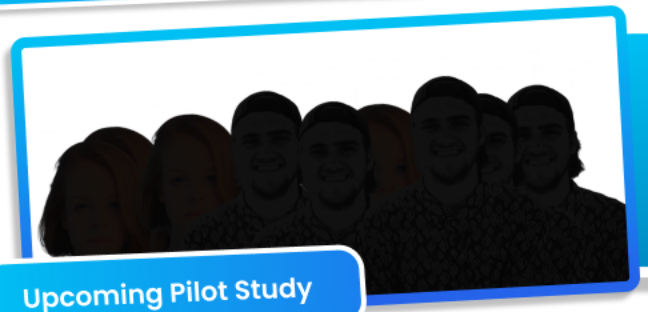
04. Progress So Far

Educational Content Preparation

Collaborated with nutrition experts to prepare diabetes education materials, ensuring DIBA's content aligns with healthcare expertise and patient needs.

Focus Group Discussion (FGD)

Conducted an FGD with women living with type 2 diabetes to understand their daily challenges, needs, and expectations, helping shape DIBA around real patient experiences.



Upcoming Pilot Study

Preparing for an application introduction session and a one-month pilot involving approximately 30 patients at a community health center in Banda Aceh, followed by System Usability Scale (SUS) and user satisfaction evaluations planned for December 2026.

05. Key Learnings

So, DIBA was quite a journey! I got to work directly with researchers, nutrition experts, and real users to figure out what the system actually needed before turning those ideas into features.

And btw, I ended up learning a lot about healthcare too! From blood glucose classifications and obesity indicators to calculating daily nutritional needs. Pretty interesting stuff for someone coming from an IT background.

I also got my hands dirty with VPS deployment, Docker, and CI/CD for the first time. Definitely a lot of trial and error, but that's what made this project such a valuable experience for me!

github.com/farhanulkhair/be-adaptivin.git

01. How It All Started

It all started when Farhan invited Shofia and me to join LIDM 2025, hoping to make it our last competition before graduation.
Farhan came up with an idea inspired by his elementary school days "some students actually want to learn math but feel too shy to ask questions". We could relate to that too!
And with so many students in one classroom, it's not easy for teachers to understand where each student struggles.
What started as a simple idea became a real concern when we discovered Indonesia's PISA 2022 math score was just 366, far below the OECD average of 472. Students struggle with math, while teachers can't always identify each student's difficulties. That's when we knew our idea was worth pursuing, and ADAPTIVIN was born!

02. Our Approach

We wanted to make math learning more engaging and personalized for every student. So, we developed ADAPTIVIN by combining a rule-based adaptive quiz that adjusts question difficulty based on students' answers and response times with Gemini AI to identify learning difficulties and recommend personalized materials and videos.

linkedin.com/in/farhanulkhair
linkedin.com/in/shofia-nurul-huda
linkedin.com/in/hidayat-nur-hakim

05. Key Learnings

Honestly, ADAPTIVIN taught me a lot, both technically and personally!

Fun fact, I designed the entire UI/UX myself! I wanted to challenge my own creativity and explore how far I could take my design ideas without relying on AI. I went with a fun, pixel-art style to make the experience more enjoyable for kids. Then came the challenge of turning those designs into a responsive frontend, integrating backend APIs, and making sure everything worked smoothly and securely.

But the biggest lessons came from working with people. From listening to students and teachers to learning from experts and lecturers, I started seeing things from perspectives I'd never considered before.

And presenting our work in front of the LIDM judges? That was a whole new experience! We didn't bring home a trophy, and yeah, it hurt a little. But looking back at everything we went through from August to December, I'm genuinely proud of what we built and how much I've grown along the way.

01. How It All Started

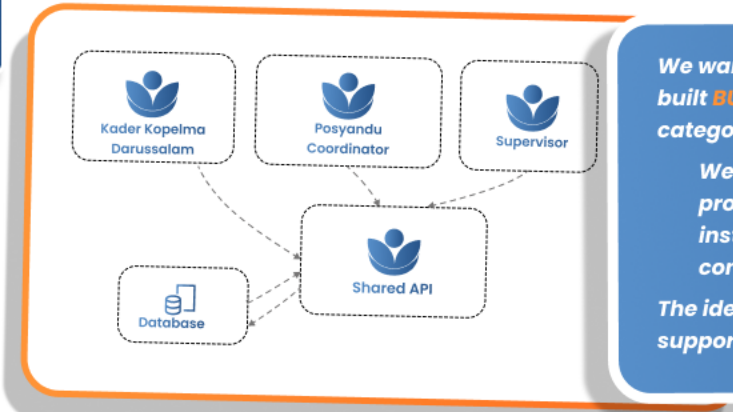
BUKADITA started as a community service project led by Ns. Arfiza Ridwan, MNS, through Universitas Syiah Kuala PKMBP-TTG program.

The idea came from a real challenge faced by Posyandu health volunteers in Kopelma Darussalam, Banda Aceh. Since January 2025, they've had to provide healthcare services for all age groups in a single session. That's a lot more responsibility! Yet, many still struggled to access complete training for the 25 essential competencies, with limited time and opportunities to learn.

To bring the idea to life, Ms. Arfiza needed support from an IT team. She collaborated with Rini Deviani, S.T., M.Eng., from the Informatics Department at Universitas Syiah Kuala, who then invited Farhan and me to join the development team.

And that's how we became part of BUKADITA (Buku Kader Digital), a platform designed to make learning more accessible for Posyandu volunteers, without relying entirely on face-to-face training.

02. Our Approach



We wanted to make training easier and more accessible for Posyandu health volunteers. So, we built BUKADITA, a digital learning platform covering 25 essential competencies across five categories, with interactive modules and quizzes.

We also added a learning progress tracking dashboard for supervisors to track learning progress and quiz results. With Progressive Web App (PWA) technology, volunteers can install BUKADITA on their devices and access cached materials even with limited internet connectivity.

The idea? Help volunteers learn anytime, anywhere, while making it easier for supervisors to support their progress.

03. Inside Bukadita

BUKADITA
Buku Kader Digital

BUKADITA
Buku Kader Digital

04. Results & Highlights

Implemented in the Community

Seeing BUKADITA being used by Posyandu health volunteers in Kopelma Darussalam, Banda Aceh, was a special moment. Our work finally reached the people we built it for!

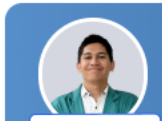
Tested & Evaluated

BUKADITA scored 93.87% in usability testing with 22 respondents, earning a Highly Feasible rating. Plus, all reported Black Box tests passed successfully!

From Community Project to Final-Year Project

I expanded BUKADITA into my final-year project in Informatics, focusing on building and evaluating its digital learning and progress tracking system.

Contributions



Mobile & BE DEV

Full Stack Dev

linkedin.com/in/farhanulkhair

linkedin.com/in/hidayat-nur-hakim

05. Key Learnings

Honestly, BUKADITA was one of my first projects where I got to work directly with so many people, from lecturers and stakeholders to the Posyandu volunteers who would actually use the platform.

One of my biggest takeaways? Learning to understand what users really need and using their feedback to shape the system.

On the technical side, as a Full Stack Developer, I learned a lot about building both user and admin interfaces, integrating frontend and backend systems, and making sure everything worked together smoothly.

And btw, I also turned BUKADITA into my undergraduate thesis! Looking back, the experience, feedback, and lessons I gained from this project made it a really valuable part of my journey.

linkedin.com/in/hidayat-nur-hakim

01. How It All Started

*It all started when we decided to join **Hackathon INFEST XI**. Before settling on **GajiBersih**, we explored tons of ideas, spent hours brainstorming, and tried to figure out which problems were really worth solving.*
*Then, during one of our **warkop discussions**, our team leader, **Ganang**, brought up something interesting **"getting your first job offer sounds exciting, but do we really understand what we're signing?"***
*We dug deeper and discovered that many Indonesian workers still struggle to understand their employment contracts, rights, and actual take-home pay. After all those discussions, we finally found an idea we truly believed in. And that's how **GajiBersih** was born!*

02. Our Approach

*We wanted to make employment contracts and salary details easier for everyone to understand. So, we designed **GajiBersih**, an **AI-powered** platform where users can simply upload their contracts or payslips and get clear, easy-to-read explanations.*
*By combining **OCR, AI, and Retrieval-Augmented Generation (RAG)**, the system extracts important details, checks relevant employment regulations, and highlights potential red flags. We also designed a **take-home pay calculator** to estimate actual earnings after taxes and BPJS deductions.*
The idea? Help people know what they're signing, understand what they're earning, and feel more confident before accepting a job offer.

FE DEV

linkedin.com/in/ganang-setyo-hadi
linkedin.com/in/achmad-atha-zayyan-1538a0244
linkedin.com/in/hidayat-nur-hakim

04. Results & Highlights

24 Hours of Coding, 4th Place

After 24 hours of coding, debugging, and working under pressure, we brought GajiBersih to life and finished 4th place at Hackathon INFEST XI! It wasn't easy, and we were so close to the podium, but we're proud of what we achieved!

And hopefully, this is just the beginning! We want GajiBersih to help workers understand their rights, avoid surprises in their take-home pay, and make smarter career decisions. With explainable AI and a privacy-first approach, we hope to make employment information clearer, more accessible, and fairer for everyone.

05. Key Learnings

Honestly, finishing 4th place left me with mixed feelings. I was proud of our work, but also a little frustrated with myself.

As the UI/UX and frontend lead, I spent too much time on certain details, causing delays and making backend integration more challenging.

I learned so much from building a project under such a tight deadline! From managing my time and setting priorities to making sure everything works together. With only 24 hours, I realized that getting the core features working matters more than making every detail perfect.

We made it work in the end, but I know I could've done better. Hopefully, I'll take these lessons into my next hackathon!

LawChain

Project Type

Intern Project

01. How It All Started

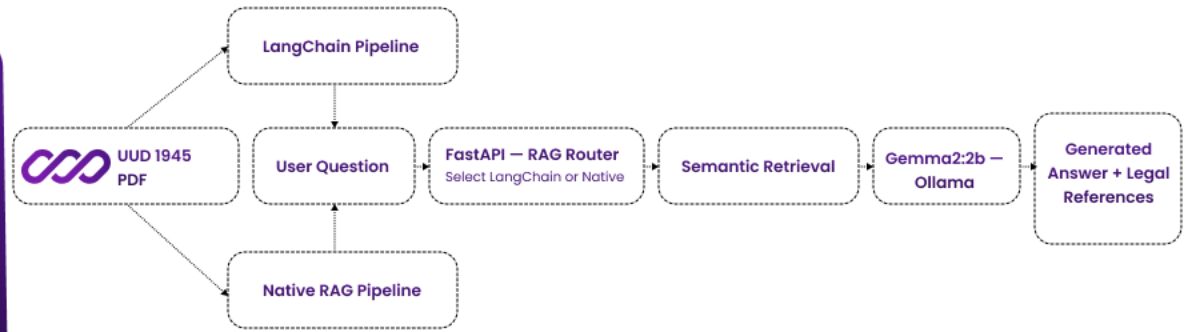
During my one-month internship at UPTD Telematika, Dinas KOMINSA Aceh, Mr. Yudi Kasmara gave me an interesting challenge: build a legal AI chatbot that runs entirely on a local machine.

> *The task was to use Retrieval-Augmented Generation (RAG) with Google Gemma 2B to answer questions about Indonesia's 1945 Constitution (UUD 1945).*

Rather than just building a chatbot, the goal was to explore how RAG actually works, from retrieving relevant legal articles to generating answers using a local AI model. And that's where my journey into building a local RAG system began!

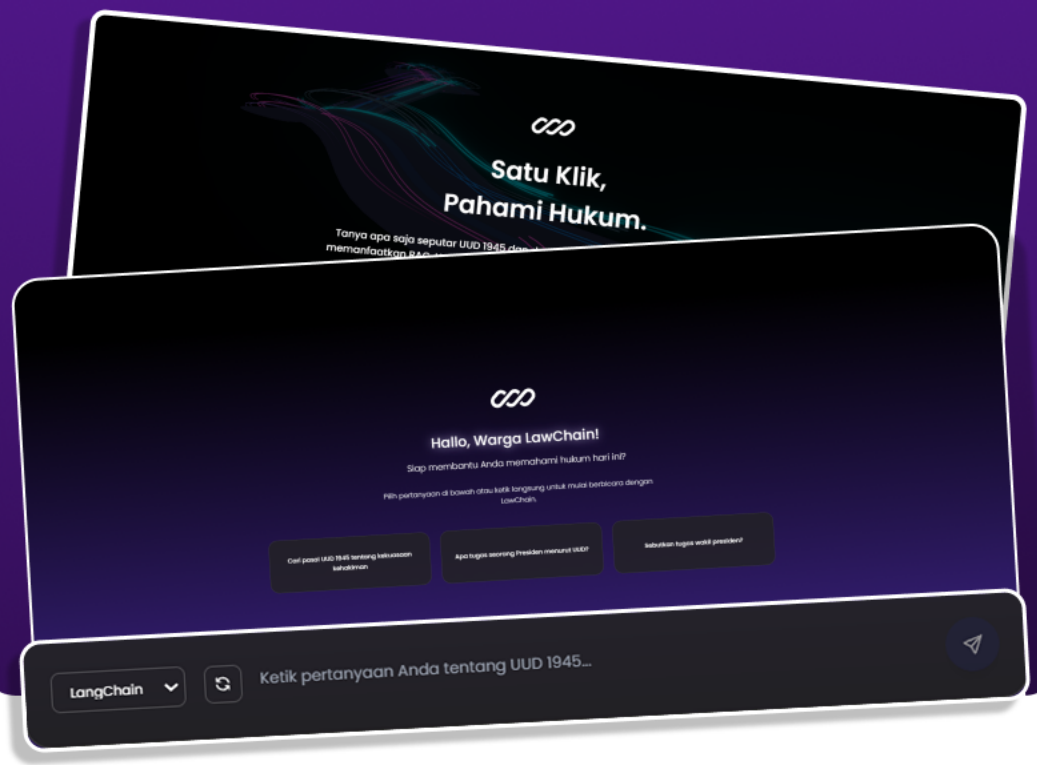
02. My Approach

I built a local RAG system using Gemma2:2b via Ollama, comparing two architectures: LangChain-based RAG and a custom Native RAG pipeline.
Both pipelines handle PDF ingestion, text chunking, Nomic Embeddings, and FAISS vector retrieval to retrieve relevant UUD 1945 articles and generate context-aware answers with legal references.
I also integrated a FastAPI backend with a Next.js frontend, allowing users to ask questions, switch between RAG methods, and compare their outputs.
The goal? Evaluate both approaches in terms of performance, flexibility, and response quality, while exploring end-to-end local AI development.



Ask Anything About UUD 1945!

A simple, interactive chatbot where users can ask questions about Indonesia's 1945 Constitution and get AI-generated answers based on relevant legal articles.



Two RAG Methods, One Interface!

Switch between LangChain and Native RAG to explore different responses, view legal references, and compare how each approach handles the same question.

linkedin.com/in/hidayat-nur-hakim

Local AI Implementation & RAG Performance Comparison

04. Results & Highlights

Successfully built and tested a local RAG-based legal chatbot using Gemma2:2b via Ollama. Testing showed that LangChain provided more reliable legal references and faster development, while Native RAG offered lower response latency and greater flexibility, but required further improvements in retrieval accuracy.

05. Key Learnings

This project gave me a much better understanding of how Retrieval-Augmented Generation (RAG) works, from document processing and text chunking to embeddings, vector search, and LLM response generation.

I also learned how to handle different PDF structures and formats, making sure the content could be properly extracted, processed, and used for retrieval.

Most importantly, building both LangChain and Native RAG pipelines helped me understand their differences, especially in terms of development speed, flexibility, retrieval accuracy, and performance. It was a valuable hands-on experience in building AI systems from the ground up.

01. How It All Started

I've loved cats since I was a kid. But growing up, I lost some of my cats to illnesses I didn't recognize early enough. At the time, I thought they were just minor health issues. By the time I sought help, their conditions had already become serious.

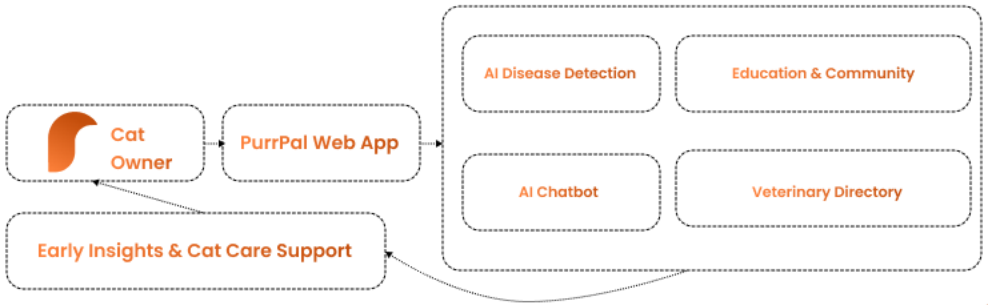
That experience stayed with me and made me realize how difficult it can be for cat owners, especially those with limited access to veterinary care, to recognize health problems early.

During Coding Camp 2025, powered by DBS Foundation, I joined a five-member capstone team. I brought this experience into our discussions, and together we explored how technology could help address the problem.

That's how PurrPal came together: an AI-powered cat healthcare platform designed to support early symptom detection, provide educational resources, and help cat owners find veterinary services.

02. Our Approach

We built PurrPal, an AI-powered cat healthcare platform that combines early disease detection, AI-assisted consultation, educational resources, a community forum, and a veterinary service directory.
Using Machine Learning, Next.js, and REST APIs, we integrated these features into one accessible web platform to help cat owners recognize potential health issues early and find the information and support they need.



One Platform for Cat Care! 🐱

A simple, user-friendly platform that brings together cat health education, community support, and veterinary information in one place.

03. Inside Purrpal

Purrpal

Meet PurrPal AI!

An AI-powered assistant that helps cat owners understand potential health issues through symptom analysis, image recognition, and interactive conversations, providing early guidance when they need it.

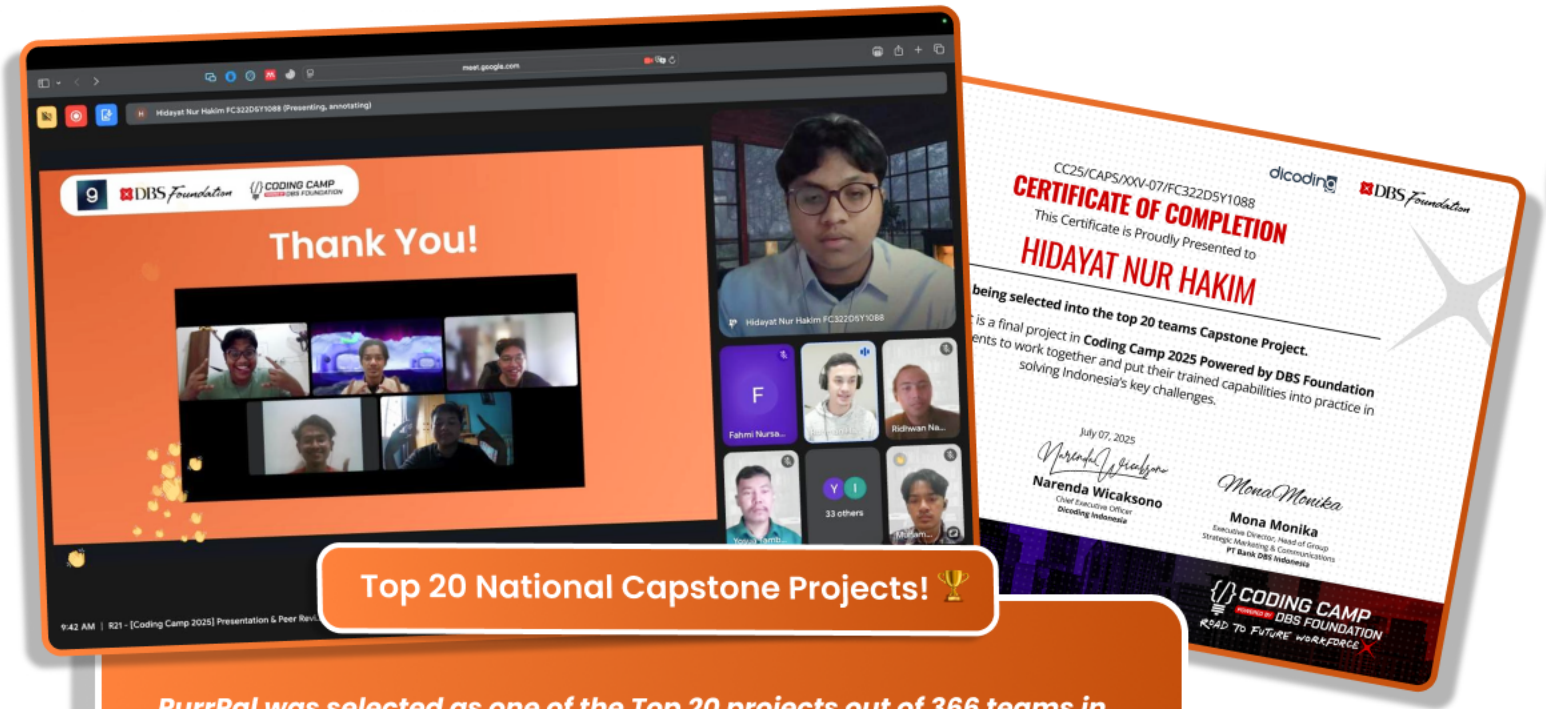
04. Results & Highlights



Top 20 National Capstone Projects! 🏆

PurrPal was selected as one of the Top 20 projects out of 366 teams in Coding Camp 2025, powered by DBS Foundation. As a five-member team without a veterinary background, we worked together to build a platform aimed at making cat health information more accessible and helping cat owners across Indonesia recognize potential health issues earlier.

05. Key Learnings

Honestly, PurrPal was a turning point for me. It was my first time collaborating with a five-member development team, and this project made me realize how much I actually enjoy software development.

I learned how to work as a team, manage code using Git and GitHub, create feature branches, handle pull requests, and merge changes into the main branch while keeping everything organized.

Beyond the technical skills, I learned a lot about communication, teamwork, and taking responsibility for my part of the project.

And seeing PurrPal make it into the Top 20 national capstone projects made the whole experience even more meaningful. It's definitely one of the projects that shaped my journey as a developer!

01. How It All Started

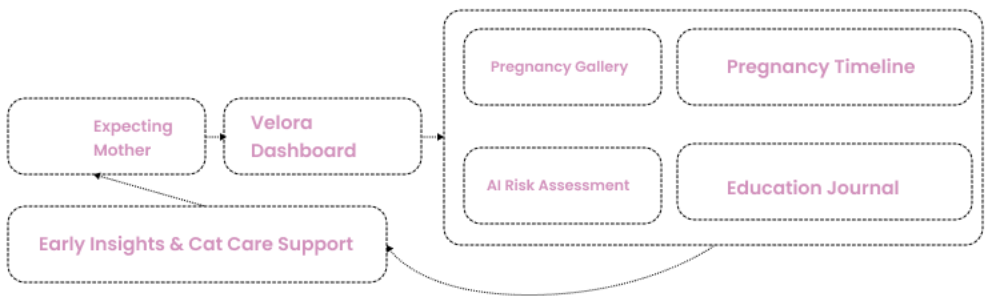
It all started with a simple thought: why is something as important as the Buku KIA (Maternal and Child Health Handbook) still mostly paper-based?

I noticed that pregnancy records, from the first to the third trimester, were often documented in a physical book. And honestly, I felt it was a shame that these valuable records and memories could be lost if the book was damaged or misplaced.

That got me thinking: what if we could bring this experience into a digital platform?

So, I came up with the idea for Velora, a web-based platform designed to help expecting mothers document their pregnancy journey, track important milestones, and keep their memories in one place. What began as a simple observation eventually grew into a project combining pregnancy documentation, health monitoring, and educational features.

02. Our Approach



We built Velora, a web-based maternal health platform that combines pregnancy documentation, health monitoring, and education in one place.

Using Next.js, Express.js, and Supabase, we developed a platform where expecting mothers can track pregnancy milestones, save photos and memories, and access educational content.

We also integrated a Machine Learning model to classify maternal health risks based on vital signs, providing additional insights to support pregnancy health awareness.

Capture Memories & Track Your Pregnancy!

Keep pregnancy memories in one place with a digital gallery for photos and videos, alongside a pregnancy journal to record health updates and track progress throughout each trimester.

Understand Your Pregnancy Health Risks!

Get an AI-powered maternal health risk assessment based on vital signs, with Low, Medium, or High risk classifications, detailed results, and helpful insights to better understand potential health concerns.

linkedin.com//in/tiara-agustin-593683343

linkedin.com/in/hidayat-nur-hakim

04. Results & Highlights

Successfully Built Velora & Won 2nd Place! 🏆

We developed a functional maternal health platform featuring pregnancy galleries, timeline tracking, health journals, and AI-powered risk assessment with 84.21% classification accuracy. Velora also earned 2nd place in a Web Development Competition, recognizing our work in combining pregnancy documentation, health monitoring, and AI technology.

05. Key Learnings

Velora was a special project for me because it was my first time winning a software development competition, taking home 2nd place!

One of my biggest lessons was learning to understand the problem before building the solution. I spent time exploring the Buku KIA, learning about pregnancy trimesters, reading health guidelines, and even asking my mom and cousins about their experiences.

On the technical side, I learned how to turn those insights into actual features, from designing pregnancy tracking workflows to integrating a Machine Learning model that classifies maternal health risks into Low, Medium, and High levels.

After reaching the Top 20 with PurrPal, winning 2nd place with Velora felt like another meaningful milestone in my development journey!

glad you're here,

Thanks for Visiting!
